Advantages of Laser Treatment of Periodontal Disease

Laser treatment of periodontal disease is a patient-friendly procedure. A laser significantly enhances treatment success rates and shortens recovery times because it prevents infection and promotes reduction in pocket depths. The laser procedure is fast and there is little bleeding. Research also shows that the use of a laser not only causes faster and more likely reattachment of the soft tissue with the tooth (after six months in almost 90% of the laser-treated tooth pockets), but also the growth of new dental tissue.
