## **Patient Friendly Laser Dentistry**

With laser dentistry the screech of the drill, painful injections and general discomfort can be a thing of the past. Dental lasers can be used for everything from dental surgery to root canal treatments. The clinical advantages of lasers for cavity preparation are that they are capable of cutting more precisely, allowing more of the healthy tooth to remain. Usually the procedure is much quicker than conventional mechanical drilling. In addition the majority of the time there is no post-operative pain reported and the healing time is quicker than with conventional techniques.
